Title : Biochemistry of the Humus-Formation Process and Some Problems of Plant Nutrition.

Orig Pub : Izv. AN SSSR. Ser. biol., 1958, No 1, 74-88

Abstract : The process of humus formation was studied with the aid of a culture of the fungi Aspergillus niger and Penicillium (sp.) (P). The nutrient medium contained the mineral salts:  $KH_2PO_4$ ,  $KCl$ ,  $MgSO_4$ ,  $FeSO_4$ ,  $ZnSO_4$  and  $NaNO_3$ . The only organic compound was glucose. In the process of developing the fungi in the nutrient medium, determination of the pH, the quantity of residual sugar (according to Bertran), the albuminous N (precipitated

Card 1/3

or the phenoloxidase type. Thereby, the possibility of biocatalysis in the formation process of humus substances is indicated. The elementary composition of the humus substances is determined. A small S/H ratio points to a lesser condensation of cycles in molecules of the

TITLE: Infra-Red Absorption Spectra of Humus Substances of the  
Soil (Infrakrasnyye spektry pogloshcheniya gumusovykh  
veshchestv pochvy)

PERIODICAL: Doklady Akademii Nauk SSSR, 1958, Vol. 119, Nr 4,  
pp. 785 - 788 (USSR)

ABSTRACT: The humus substances are the most characteristic compounds  
of the organic part of the soil. They were often investigated.  
Since, however, many problems connected with them are com-  
plicated and the nature of the substances varies according  
to the conditions of the soil formation, a number of problems  
concerning their nature and structure is not explained. In  
the present paper results are given of a comparative investi-  
gation of the structure of the humic-and "fulvic" acids, as in  
the title, and by means of radiographic method. As samples  
served: common black soil and lawn bleaching earth, both  
different to a great extent from each other. The method of

Magnetic Properties of the FeSi<sub>3</sub>N<sub>4</sub>

Semiconducting Nitride

Samonova A.M. et al. Sov. Phys. Solid State 26, No. 3, p. 622, 1983

March 1983 Sov. Phys. Solid State 26, No. 3, p. 622, 1983

In Russian. A brief theoretical analysis is given of the magnetic properties of a number of compounds of the formula Fe<sub>x</sub>N<sub>y</sub> for x > 1. A comparison is made between the calculated values of the magnetic susceptibility for the case of garnet-like structures and experimental results reported in Russia (Solid State Physics 26, 1984) over a large temperature range.

TITLE:

On the Problem of Cold-Air Currents in the Basin of Mountains  
of the Issyk-Kul' District in Winter (K voprosu o kholodnykh  
vkhozhdeniyakh v rayon Issyk-Kul'skoy kotloviny zimoy).

50-1-5/26

PERIODICAL:

Meteorologiya i Gidrologiya 1958, Nr 1, pp. 27-30 (USSR)

ABSTRACT:

The region of the Issyk-Kul' mountain basin is in the physical-geographical respect a separate region. The level of the Issyk-Kul' lake which fills the central part of the basin lies in an altitude of 1609 m above the sea level. The mountain chains enclosing this lake in the north (Kungey-Alatau) and in the south (Terskiy-Alatau) have heights of predominantly 3500-4000 m with individual peaks of more than 5000 m. These mountain chains combine in the east to the Kzyl-Ompul highland behind which the mountain-pass "San-Tash" lies; in the west the chains combine to the Tasma highland which in a height of 250-300 m is intersected by the narrow (up to 1 km wide) gorge of Buamsk. All this leads to an isolation of the district. Mild winters are characteristic of the climate of the Issyk-Kul' region. A great disturbance of the usual winter conditions prevailing on the lake is the penetration of cold air masses accompanied by strong winds, the drop of

Card 1/3

of the Issyk-Kul' District in Winter. 50-1-5/26

temperature, the spreading of clouds (mainly of the cumuli) with increased precipitations in fall winter, not seldom also with the formation of thunderstorms. The intensity of the penetration of cold air masses depends on the thickness of the penetrating air mass and the temperature difference between the incoming and the displaced air, which generally expressed by the difference of the atmospheric pressure in the basin and in the same altitudes outside. Above the mountain-basin of Issyk-Kul' after passage of the front on November 25, the simultaneous and intensive pressure rise in all stations began (25-30 millibar in three days). But it substantially lagged behind the corresponding rise outside the basin, above the northern foothills. The main causes of this phenomenon by A. A. Listovskiy's opinion are the following:  
1) The seclusion of the mountain-basin. The cold air penetrates into the basin only gradually and only through the individual valleys. 2) The adiabatic warming. The arctic air with a vertical temperature gradient of  $0,4^{\circ}$  -  $0,6^{\circ}$  in the altitude of 100 m. The air crossed the mountains, descended 1 km in the basin and became by  $4$  -  $6^{\circ}$  C warmer than in the same altitude outside the mountains. 3) Warming due to contact

Card 2/3

On the Problem of Cold-Air Currents in the Basin of Mountains      50-1-5/26  
of the Issyk-Kul' District in Winter.

with the surface of the warm lake-water. In the course of the entire period of penetration of the cold air masses essential differences between the temperature and the pressure in the basin and outside it were maintained. Based on the observations performed it was determined that the cold-air flows most frequently occur in fall and in winter (November-December), that they are durable and cause a gradual but considerable decrease in temperature. In spring these flows are small and of short duration because the air outside the basin begins to warm through, but their warming above the lake is retarded. The calculations given in the article, due to the too small number of observation years, naturally only possess a value of orientation, but they characteristic of this phenomenon.

TITLE: Boundaries of the natural seasons in East Siberia

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 3. 1962, 51, abstract 3B374 (Izv. AN SSSR, ser. geogr., no. 6, 1961, 67-72)

TEXT: The aim of the work was to establish more precisely the duration, the structure, and some peculiarities of the year's natural seasons in East Siberia. The investigation was made with B. L. Dzerdzevskiy's data for the typification of circulation processes. The seasonal boundaries were determined for two decades. ("epochs"): 1906 - 1915 and 1944 - 1953. The choice of these "epochs", separated by a large time interval, allows the multiyear changes in the character of the atmospheric circulation and the East Siberian climate to be appraised for a 50-year period; it also ensures more precise conclusions when comparing processes of a diverse character. The following materials were used: Daily synoptic maps for

Boundaries of the ...

both "epochs"; Dzerdzevskiy's basic schemes of circulation types; the catalog of synoptic situations for 1899 - 1955 (the calendar of the change of elementary circulation mechanisms); maps of the mean pressure distribution in each of the types; data on the average frequency of cyclones and anticyclones; tables of the frequency of different circulation types; and meteorologic, hydrologic, and phenologic data. Meridional circulation prevailed in the first decade (104.7 days a year); in the second its duration decreased to 10.8 days per annum. The pre-vernal season, spring, and autumn in the second "epoch" began earlier, and lasted longer than in the first, but the summer and the winter were shorter. This is explained by the fact that cyclonic activity and its associated zonal transfer attain their maximum development in the transitional seasons. The zonal circulation, however, was more intense in the second "epoch". Thus, the change in the atmospheric circulation's general character is reflected in the dates of onset of the natural seasons and in their duration. Owing to the intense cyclonic activity the transitional seasons lengthen -- and the main ones, es-

East Siberia

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 11, 1962, 67,  
abstract 11B377 (Izv. Vses. geogr. o-va, 94, no.3,  
1962, 255-257)

TEXT: East Siberian circulation conditions that were observed in two 10-year periods (1906-1915 and 1944-1953) are compared. The meridional form of circulation prevailed in the first; the zonal form predominated in the second. The change in the prevalent circulation form was reflected in the variation of the number and direction of Arctic invasions. These were rarer in the second 10-year period, and their routes shifted eastwards (in all seasons, especially in winter).

TITLE: The Case of a Retarded Hydrogen Exchange in the > N-H Group  
(Sluchay zamedlennogo vodorodnogo obmena v gruppe > N-H)

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye khimicheskikh nauk,  
1958, Nr 12, pp 1493-1494 (USSR)

ABSTRACT: In this brief report the authors mention that the isotope exchange of hydrogen in the NH-group of dimethyl carbethoxy pyrrole takes place comparatively slowly. It turned out to be possible to measure the kinetics of this reaction at different temperatures. The velocity constants were calculated by a first order equation. The experiments were carried out at 12, 15, 20, and 25°.  $K_{12} = 3.2 \cdot 10^{-5}$ ;  $K_{15} = 5.6 \cdot 10^{-5}$ ;  $K_{20} = 1.07 \cdot 10^{-4}$ ;  $K_{25} = 2.21 \cdot 10^{-4}$  in sec<sup>-1</sup>. Apparent activation energy = 25500 cal. The retarded hydrogen exchange which took place in this case is interpreted from the viewpoint of the theory developed by A. I. Brodskiy. There are 2 references, 1 of which is Soviet.

SOURCE: Zhurnal prikladnoy spektroskopii, v. 3, no. 3, 1965, 285-289

TOPIC TAGS: xenon lamp, impulse lamp, optical pumping, optical quanta generator

ABSTRACT: In order to develop reliable lasers for use as optical pumps in various solid state devices, the performance of 8 different Xe lamps was studied. Lamps having straight and cylindrical spirals and flash energy output between 200 to 2000 joules were studied. The spectral distribution, light intensity, and electrical resistance of the lamps were determined. The results are presented in tables and graphs (see Fig. 1). It is concluded that the observed saturation of radiant energy  $F_\lambda$  in the region of 900 Å for the lamp IP-400 (400 mm Hg Xe) is

"Sulfur in Cast Irons Treated With Magnesium and Cerium," A.D. Ushakov, T.A. Kononova, Candidates Tech Sci.

"Litey Proizvod" No 7, pp 22, 23

Studies influence of sulfur on process of obtaining cast iron with spheroidal graphite during inoculation with Mg and Ce. There is no significant desulfurization of cast iron caused by addn of these inoculants. Sulfur, combined with Mg and Ce in form of complex compds of sulfides, cannot be detd by usual methods of analysis. These sulfides remain in metal and decompose at high temp during overheating liquid cast iron.

Title : About certain physico-chemical properties of polyvinyl alcohol esters

Periodical : Izv. AN SSSR. Otd. khim. nauk 2, 335 - 343, Mar-Apr 1955

Abstract : Tests were made to determine the vitrification temperatures and mechanical properties of complete polyvinyl alcohol esters and formic, propionic, n-butyric and isobutyric acids and a series of products obtained through their partial saponification. The vitrification points were found to be constant up to a free hydroxyl content of 30 mol%; they increase in proportion to the drop in ester group content. The anomalous change in the vitrification point of formic esters of polyvinyl alcohol is explained. The strength, modulus and elongation of polyvinyl alcohol ester films were determined in vitreous and high-elastic states. Nine references: 8 USSR and 1 German (1939-1955). Tables; diagrams.

PURPOSE: This collection of articles is intended for scientific workers and technical personnel of research institutes, plants, and schools of higher technical education.

COVERAGE: The collection contains papers presented at a convention held in Kiyev on Problems of Physical metallurgy and methods of the heat treatment of metals applied in the machine industry. Phase transformations in metals and alloys are discussed, and results of investigations conducted to ascertain the effect of heat treatment on the quality of metal are analyzed. The possibility of obtaining metal with given mechanical properties is discussed, as are problems of steel brittleness. The collection includes papers dealing with kinetics of transformation, heat treatment, and properties of cast iron. No personalities are mentioned. Articles are accompanied by references, mostly Soviet.

TITLE: Hygienic evaluation of regional planning schemes in some oblasts of the RSFSR

SOURCE: Gigiyena i sanitariya, no. 7, 1964, 60-62

TOPIC TAGS: industrial hygiene, sanitation

Abstract: According to the author, evaluation of 24 rural construction projects in the RSFSR from the hygienic and sanitary standpoint indicated that although the majority of these projects were sound in concept, some of them were deficient in that no provisions were made for the disposal of garbage, little breeding farms were to be located too close to villages, adequate provisions were not made for the planting of trees and gardens in villages, etc. Reasons for these defects in planning are discussed and some remedies suggested.

AUTHOR: Kononova, V.A.

TITLE: Urtite-Iolite Intrusions in Tuva and the Role of Metasomatic Processes in their Formation (Urtit-iolitovyye intruzii Tuvy i rol' metasomatischeskikh protsessov pri ikh formirovani)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geologicheskaya, 1957, v. 2<sup>2</sup>, # 5, pp 37-55 (USSR)

ABSTRACT: The paper describes characteristics of the urtite-iolite intrusions in the new alkaline province of south-eastern Tuva. The Dakhunurskaya intrusion, connected spatially with pyroxenites and accompanied with vein-like carbonate bodies, is of a special interest in connection with the problem of the origin of complex natural associations (ultrabasic - alkaline - carbonatite rocks). Its study is especially important, because deposits of apatite, iron ores and niobium minerals are associated in some regions of the Soviet Union and abroad with similar massifs.

TITLE: Urtite-Iolite Intrusions in Tuva and the Role of Metasomatic Processes in their Formation (Urtit-iyolitovyye intruzii Tuvy i rol' metasomatičeskikh protsessov pri ikh formirovanií)

The Dakhunurskaya intrusion is represented in a modern erosion section by two bodies which are named by the author the western and eastern bodies. The western body is mainly composed of iolites enriched with calcite in its central and southern parts. The eastern body has a more complicated structure; urtites and iolite-urtites are spatially associated with earlier pyroxenites. The Dakhunurskaya intrusion is accompanied with 2 large pegmatite veins of nepheline-zeolite composition with admixtures of fluorite, schorlomite and zircon.

The Chikskaya intrusion consists of several bodies, the main part of which extends in north-western direction. It is accompanied with 3 satellites of considerably smaller dimensions. The main body of the Chikskaya intrusion is composed of iolite-urtites, iolites, calcite-containing urtites, calcite-nepheline and carbonate rocks.

TITLE: Urtite-Iolite Intrusions in Tuva and the Role of Metasomatic Processes in their Formation (Urtit-iyolitovyye intruzii Tuvy i rol' metasomatičeskikh protsessov pri ikh formirovanií)

The urtite-iolite intrusions are deposited between marbles of the Upper-Proterozoic age. Contacts with marbles are outcropped in the Chikskaya intrusion. In the Dakhunurskaya intrusions active contacts with pyroxenites were also discovered. These contacts are accompanied with nephelinization which spreads over a considerable zone (thickness is up to 50 m).

Proper magmatic nepheline rocks of these intrusions do not contain feldspar and belong to the urtite-iolite type whose main minerals are nepheline and pyroxene. When nepheline dominates (95 to 85 %) this rock is held as urtite, and when shares of nepheline and pyroxene are almost equal it is held as iolite.

Metasomatic processes in the urtite-iolite rocks resulted in the formation of garnet-containing iolites and "Kozenites" (rock composed of calcite of not-biogenic and not-sedimentary origin, nepheline and pyroxene).

AUTHOR: Kononova, V.A. 11-58-6-4/13

TITLE: On the Nephelinization of Pyroxenites and Marbles (O nefelinizatsii piroksenitov i mramorov)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geologicheskaya, 1958,  
Nr 6, pp 58-68 (USSR)

ABSTRACT: The author describes the formation of nepheline in pyroxenite and marble which she studied in the Balyktyg-Khem river region (South-East of Tuva). The formation of nepheline in pyroxenite (Dakhu-Nur intrusion) and in marble (Chik Intrusion) are found exclusively in the zones of contact with the urtite-iolite intrusions, and could be regarded as an unusual contacting process. The nephelinization of pyroxenite is accompanied by the development of characteristic poikiloblastic and corrosive textures - a result of a late appearance of nepheline which metasomatically replaced the pyroxenites. The nephelinized pyroxenite is heterogeneous in composition and has a taxitic texture. In the Chik intrusion, rocks of the urtite-iolite group occur in marble and contain xenoliths. The development of nepheline in marble is observed at points of contact with the intrusion. The xenoliths are of

Card 1/2

On the Nephelinization of Pyroxenites and Marbles

11-58-6-4/13

different formations. In some places they are transformed into silica-carbonaceous rocks. The content of silicate minerals (nepheline, pyroxene and apatite) varies from 5 to 70%. Iolite-urtite rock, especially near the point of contact with marble, are transformed into melteigites for a zone of about 15 cm and contain 23% calcite. The nephelinization of pyroxenites described by the author is similar to the nephelinization observed in South Africa  
[Ref 6].
